Radiation Testing of IEEE1394 FireWire

S. Buchner, C. Seidleck, H. Kim, P. Marshall and K. LaBel
Radiation Effects and Analysis Group NASA/GSFC

• NASA Electronic Parts and Packaging (NEPP) Program’s Electronic Radiation Characterization (ERC) Project
• DTRA RHM
Outline of Talk

- Introduction
- Description of the IEEE1394
- Radiation testing performed
- Results observed
- Implications
Introduction

• Separate components on satellites that need to communicate with one another over moderate distances can use:
  – serial bus
  – parallel bus

• IEEE 1394 is a universal non-proprietary standard that describes software and hardware needed for a digital serial bus and is based on Apple Computer’s original FireWire.
Features of IEEE 1394 Serial Bus

- Specifications for \textit{backplane} and \textit{cable}
  - Cable contains 6 wires with maximum length of 4.5 meters.
  - Cable minimizes wire harness, provides power, reduces cross talk.
- More than one node can access the bus at a time.
- Inexpensive, available, reliable - COTS.
- Scaleable 100, 200, 400 MHz (800, 1600 and 3200 MHz).
- Two modes - Isochronous and Asynchronous.
- 256 Terabytes of addressable memory-mapped space (48 bits per node, 63 nodes per bus segment and 1024 bus segments).
- Plug and play.
Topology of Typical PC-based IEEE1394

- Physical ID 0: Digital VCR
  - Physical ID 3
    - Physical ID 4: PC
      - Physical ID 1: Fixed disk drive
      - Physical ID 2: DV Monitor
      - Physical ID 6: Fixed disk drive
    - Physical ID 5: DV Camcorder
  - Physical ID 2
    - Physical ID 0: DV Camcorder
  - Physical ID 1: Fixed disk drive
- Physical ID 6: Fixed disk drive

Transmission Modes

- **Isochronous transfers are time-critical and error-tolerant**
  - 1-to-1 or 1-to-many
  - No error correction or retransmission
  - Bandwidth assigned by resource manager
  - 80% of bandwidth devoted to Isochronous transmission
  - Maximum bandwidth determined by how much already assigned

  Eg. video or audio streaming

- **Asynchronous transfers are not error-tolerant**
  - Specific node targeted
  - Acknowledged and responded to for error checking and retransmission
  - Not guaranteed bandwidth

  Eg. critical data transfer from disk
# Primary Asynchronous Packet Format

Registers

• LINK Registers
  – 42 out of 102 OHCI registers were monitored
  – 21 out of 22 PCI registers were monitored

• PHY Registers
  – None of the 16 registers in the PHY were monitored
Radiation Characterization

- Protons and heavy ions used to test parts from Texas Instruments and National Semiconductor.

- Irradiate PHY and LINK chips separately on DUT board.

- National Semiconductor part underwent destructive when irradiated with ions having a LET = 27 MeV.cm²/mg. Therefore, did a full characterization on the TI parts only.
Radiation Test Setup

- Host PC
- 1394 DUT
- 1394 Cable
- 1394 Board
- Remote PC
- Monitor, keyboard & mouse
- Monitor, keyboard & mouse
Asynchronous Mode

Setup
- Lockdown memory
- Set node ID
- Enable receive contexts ARxRQ, ARRS
- Set delay
- Turn on interrupts

CTRLR

DUT
Asynchronous Mode

Setup
- Lockdown memory
- Set node ID
- Enable receive contexts ARxRQ, ARRS
- Set delay
- Turn on interrupts

- Determine test type OHCI/PCI or PHY

• Form data solicit packet and send to DUT

ARRS
- Compare data
- Log errors
- Continue test loop

ATRQ

Register data solicit quadlet packet

ARxRQ
- Determine test type requested
- Poll OHCI/PCI or PHY regs
- Form Data Response Packet

Register data block packet response

ATRS

ARRS
- Determine test type OHCI/PCI or PHY
- Poll OHCI/PCI or PHY regs
- Form Data Response Packet

Register data block packet response

Asynchronous Mode

Setup
- Lockdown memory
- Set node ID
- Enable receive contexts ARxRQ, ARRS
- Set delay
- Turn on interrupts

- Determine test type OHCI/PCI or PHY

• Form data solicit packet and send to DUT

ARRS
- Compare data
- Log errors
- Continue test loop

ATRQ

Register data solicit quadlet packet

ARxRQ
- Determine test type requested
- Poll OHCI/PCI or PHY regs
- Form Data Response Packet

Register data block packet response

ATRS
Asynchronous Mode

Setup
- Lockdown memory
- Set node ID
- Enable receive contexts ARxRQ, ARRS
- Set delay
- Turn on interrupts

- Determine test type OHCI/PCI or PHY

- From data solicit packet and send to DUT

  - ARxRQ
    - Compare data
    - Log errors
    - Send dummy response
    - Send ATRQ

  - ARRS
    - Compare data
    - Log errors
    - Continue test loop

  - ATRQ

- Wait for interrupt

  - ARxRQ
    - Determine test type requested
    - Poll OHCI/PCI or PHY regs
    - Form Data Response Packet

  - Register data solicit quadlet packet

  - ATRQ

  - Register data block packet response

  - ATRS

  - If Timeout send data via ATRQ

  - Dummy response quadlet packet

  - ATRQ

  - ATRS

  - ARRS
    - Dummy response
Isochronous Mode

Setup
- Lockdown memory
- Enable ARRS for bus reset packets
- Turn on Isoch RX context
- Turn on interrupts

- Form Isoch register data solicit packet

Isoch TX

- Wait for interrupt

- Poll OHCI/PCI registers
- Build data packet

Isoch RX

- Compare register values
- Log errors continue loop

Isoch TX

CTRLR

DUT

Register data block packet

Register data solicit packet
## Testing Approach - Error Categorization

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>SEU test loop is restarted on the controller i.e. a packet is sent to DUT requesting register information</td>
</tr>
<tr>
<td>2</td>
<td>Software bus reset. Force root (R bit), set IBR (initiate bus reset) in the PHY, Reset node on the LLC (HCCC register, set bit 16 –Soft Reset) This restores OHCI registers and flushed FIFOs. Set bus Ops, IRMC, CMC, ISC, configuration ROM, Enable Rx (receive) and Tx(transmit).</td>
</tr>
<tr>
<td>3</td>
<td>Reload Software application. This refreshes the lockdown memory region shared between the software and hardware.</td>
</tr>
<tr>
<td>4</td>
<td>Step 2 followed by step 3.</td>
</tr>
<tr>
<td>5</td>
<td>Able to verify that the controller is sending register data solicit packets to the DUT. Able to verify that the DUT receives the register data solicit packet. Able to verify that the DUT sends register data packet response to the controller. Able to verify that the controller cannot see the register data response packet. Power cycle the controller.</td>
</tr>
<tr>
<td>6</td>
<td>Disconnect/reconnect the 1394 cable. Causes hard bus reset, tree ID process.</td>
</tr>
<tr>
<td>7</td>
<td>Step 6 followed by steps 3, 2, and 1.</td>
</tr>
<tr>
<td>8</td>
<td>Step 6 followed by cold rebooting DUT followed by steps 3, 2, and 1.</td>
</tr>

Results LINK Irradiated

\[ y = 6 \times 10^{-5} \times (1 - \exp(-((x-2)/20)^{1.15})) \]

\[ y = 2 \times 10^{-5} \times (1 - \exp(-((x-2)/40)^{0.645})) \]

Effective LET (MeV cm\(^2\)/mg

Effective LET (MeV cm\(^2\)/mg) vs. SEFI Cross Section (cm\(^2\)/device)
Results - LINK Irradiated

\[ y = 0.0003 \times (1 - \exp(-((x-2.5)/30)^{1.1})) \]

\[ y = 0.0001 \times (1 - \exp(-((x-2.5)/30)^{1.15})) \]

Effective LET (MeV cm²/mg)

SEU Cross Section (cm²/device)
Conclusions

- NS part exhibited destructive latchup at LET=27 MeV.cm²/mg
- TI part exhibited both SEUs (soft errors) and SEFIs (hard errors)
- At low LETs the errors are mostly soft errors
- The presence of SEFIs resulting in rebooting of the system makes this part problematic for space.
- SEU in the DUT cause a SEFI that requires rebooting the Controller
- An improved test would involve:
  - automatic reboot
  - another device
