Creating an object through adding material rather than taking it away

Fused Deposition Modeling

Thermoplastic filament is heated to a semi-liquid state and extruded across computer-controlled tool paths to build parts layer-upon-layer.

Material Jetting

Deposits droplets of UV-cured resins in multiple colors and textures for fine detailed prototypes

Laser Sintering

Uses a laser to fuse metal or thermoplastic powders layer-by-layer to produce highly complex geometries from sliced CAD data

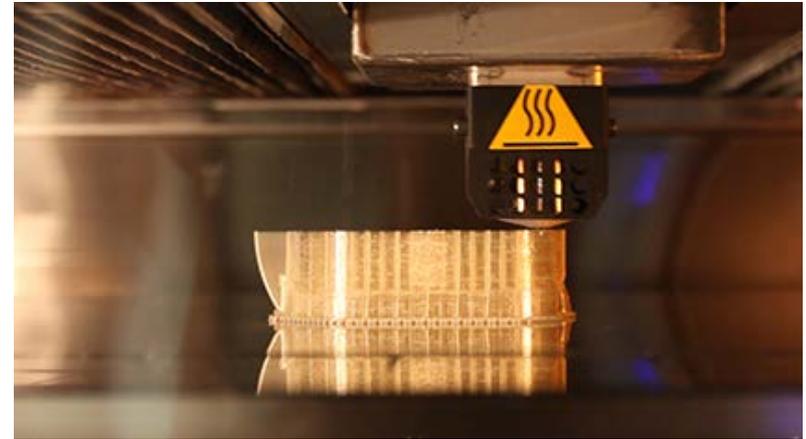

Acquisition Cost

Operational Cost (Weight Reduction)

Vertical Solutions

Stratasys is accelerating its efforts into markets where disruptive solutions can unlock significant value across enterprise manufacturing processes

New Vertical Solutions Business Unit (VBU) enables market-specific value creation with dedicated and focused resources developing unique market-specific solutions and/or go-to-market strategies

Focused global team combines technical, commercial, and market-specific expertise to drive and support accelerated vertical penetration today while improving the vertical value proposition tomorrow

Goal to maintain and grow market leadership in each identified strategic vertical market

VA Innovation Creation Series: Challenge #1

by VA Center for Innovation

This Challenge invites you to create an attachment or accessory

What is a Challenge?

Use the power of our global online community to apply thousands of engineering minds to your design problem for less than the price of one.

Whether you have a brand new invention on the back of an envelope and you need to turn it into reality, an old part that has stubbornly never worked quite right, an aesthetic challenge you'd like the design world's opinion on, or you'd just like to inject some fresh ideas into your current in-house design department, a GrabCAD Challenge is the most effective way to get the engineering world working on your problem.

A GrabCAD challenge is also a great way to let the world know about your company, your exciting or new products and your passion for optimum design.

How Does this Work?

- You decide what amount of prize money to sponsor. We'll guide you as to what to expect for various challenge levels, how many prize levels to offer, etc. GrabCAD charges an administrative fee

Jet engine bracket challenge.

GRABCAD

DEADLINE

Passed

TOTAL ENTRIES

640

All aircraft engines require the use of efficient and cost effective brackets. Additive manufacturing creates opportunities to build unique and highly efficient bracket-like structures. Here is an opportunity to show your best design.

When designing critical components for aircraft engines, today's designers are constantly challenged with the tradeoff between performance requirements for strength and stiffness on one hand and size and weight on the other. Recently, software tools have been developed to aid designers in optimizing their part designs. However, today's manufacturing methods restrict designers ability to take advantage of these optimized structures beyond a certain level of complexity. Additive manufacturing is lifting the constraints of traditional manufacturing processes, giving designers the ability to grow practically any shape, enabling the use of fully optimized lightweight designs that do not sacrifice performance.

Participants in this challenge will use additive manufacturing as the basis for optimizing an existing aircraft engine bracket.

NASA Handrail Clamp Assembly Challenge

About this Challenge

NASA is seeking to challenge the GrabCAD Community by sponsoring an open competition where participants utilize the new additive manufacturing capability on the International Space Station (ISS). The competition will be to design a complementary Handrail Clamp Assembly (HCA) which is currently utilized by astronauts to provide rigid mounting locations required in a microgravity environment for normal daily operations. The complementary HCA design will be referred to as the CHAMP (Clamp for Handrail with Additively Manufactured Parts). The printed part will be analyzed to further our understanding of the effects of microgravity on the fused deposition method of manufacturing.

"We developed the Center of Excellence for Collaborative Innovation so we could work with groups like GrabCAD, which has almost 2 million members, and tap the creativity of the world to solve tough engineering problems. Using innovators to contribute to solutions to technical challenges is playing a crucial role for NASA in developing the technologies needed for humans to become Earth-independent and pioneer missions to Mars and other deep space destinations."

Jason Crusan, Director of NASA's Advance Exploration Systems Division

"We, at NASA, were overwhelmed with both the quantity and quality of the submissions for the NASA GrabCAD Challenge! Going into this, we were confident that we would benefit greatly from the experience that this broad community of talented designers brings to the table, but we were extremely impressed with the level of interaction, creativity, and iterations that took place within the community throughout the challenge process. The capability to exchange technical ideas and gain feedback during the challenge was as impactful as the submissions themselves. NASA hopes to have the opportunity to utilize this high-value, high-impact collaboration mechanism more in the future."

The CubeSat Challenge

Description **Entries 211**

The CubeSat Challenge

Stratasys DIRECT MANUFACTURING
MakerBot
GRABCAD

This Challenge invites you to re-think the CubeSat using additive manufacturing!

DEADLINE	Passed
TOTAL ENTRIES	211

Who's in the jury?

-  **Jordi Puig-Suari**
Professor at California Polytechnic State University and co-inventor of the CubeSat Standard
-  **Jonathan Cook**
Director of Product at MakerBot
-  **Adam Hadaller**
Mission Manager at Spaceflight Industries
-  **Patrick Price**
Aerospace Additive Manufacturing Research Engineer at Stratasys
-  **Jesse Marin**
Aerospace Project Engineer at Stratasys Direct Manufacturing

About This Challenge

The goal of this challenge is to design a small satellite frame optimized for additive manufacturing. By using the benefits of design for additive manufacturing (DFAM) principles:

- Mass distributions and materials can be rethought to minimize weight
- Part count can be reduced to improve producibility and ultimately, cost can be reduced.

 **Jordi Puig-Suari**
Professor at California Polytechnic State University and co-inventor of the CubeSat Standard

 **Jonathan Cook**
Director of Product at MakerBot

 **Adam Hadaller**
Mission Manager at Spaceflight Industries

 **Patrick Price**
Aerospace Additive Manufacturing Research Engineer at Stratasys

 **Jesse Marin**
Aerospace Project Engineer at Stratasys Direct Manufacturing

 **David Espalin**
Center Manager at W.M. Keck Center for 3D Innovation, University of Texas

 **Robert Hoyt**
CEO & Chief Scientist at Tethers Unlimited Inc.

It is a simple printable part. You can apply either additive technology. Just print two same parts, turn to faces to each other and connects!

-- DESIGN AND ADVANTAGES --

Benefits of this design:

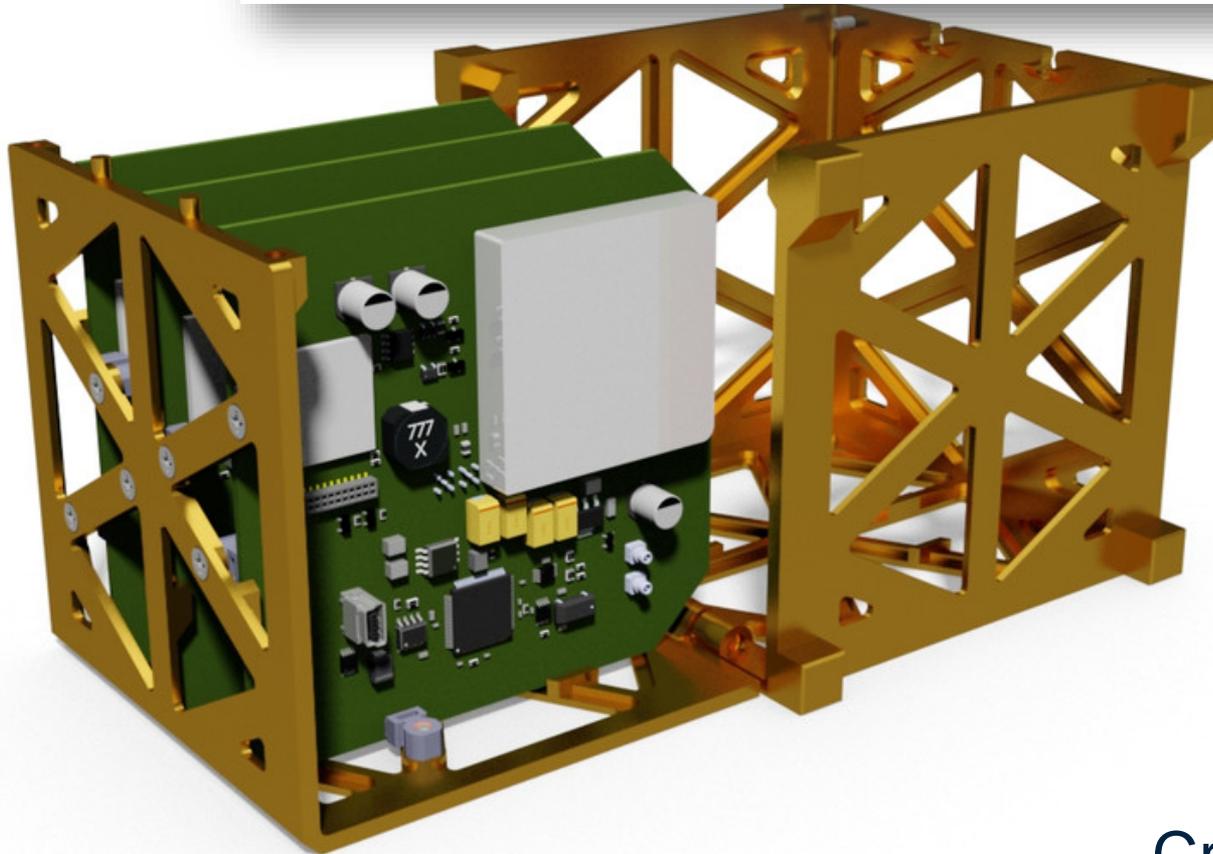

- Structure is only one single part.
- Helicoil reinforced solar panel mounting holes to attach and remove side panels many times.
- Possible to manufacture with current technologies.
- Mass of 1U aluminium structure is only 54 grams. It really is that low. Likely can be reduced even more.
- Made from aluminium. Does not cause additional thermal, radiation or outgassing concerns.
- Quick and easy modifications, might just have to change PCB distance and thickness.
- Deployment switch and separation spring are integrated as one.
- Scalable to 12U and more, depending on exact configuration.
- Conforms to CubeSat Specification and launcher requirements.

Credit: Paul Lias

The Wells CubeSat was specifically designed to:

1. Reduce the overall part count by designing a 1-piece unibody structure, allowing for a more simplified producibility using materials that are commercially available, reducing overall cost.
2. Reduce the weight of the structure while maintaining enough strength to survive the environmental requirements.
3. Create a structure that would reduce the CubeSat payload environment by reducing the loads generated by the vehicle and qualification random vibration environments.

Credit: Stephen Wells₁₅

The main feature in the design is the flat print configuration. This low Z-Height is optimal for additive manufacturing, since print time is highly dependent on part height. Hinges are printed into the structure that allow it to be articulated into the standard cube shape once the print has been completed. As each panel is raised, a snap fitting will connect it to its neighboring side panel. This fitting will hold it in place during the rest of assembly. Once the frame is fully assembled, a counter-sunk screw is used in each corner to securely fasten the sides together. This will allow the CubeSat to withstand the vibrations of the launch environment.

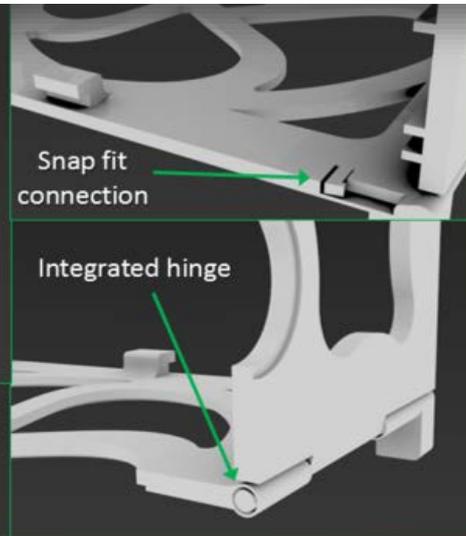

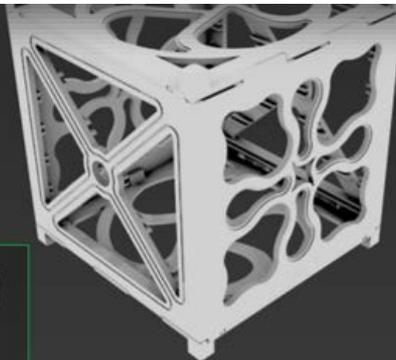

Credit: Chris Esser

The FoldSat is a foldable version of the 1U CubeSat. The FoldSat is designed for additive manufacturing to minimize manufacturing time and support material waste. The FoldSat is composed by two parts, a base and a cover.

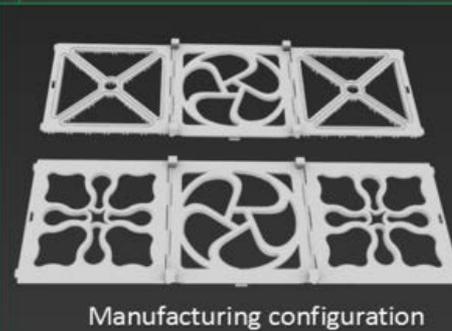

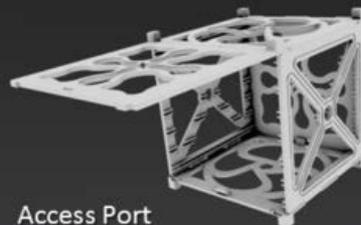

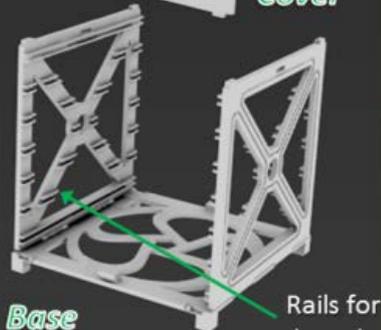

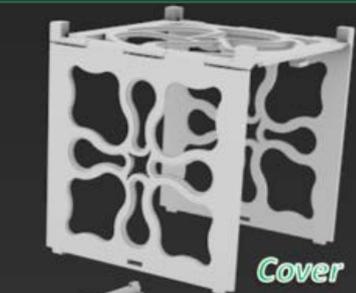

Each part contains three faces of the 1U cube and can be manufactured as one piece because it is an assembly integrating the hinges to fold the lateral faces of the cube together with some snap fits allowing for the connection between the base and the cover.
